1 Introduction

This parser plugin allows to read tag values from ControlLogix, PLC 5, SLC 500 and MicroLogix controllers using EtherNet/IP protocol. The parser uses "Unconnected Messages" with PCCC-style commands. EtherNet/IP is an industrial network protocol that adapts the Common Industrial Protocol to standard Ethernet.

Features:

- Can send valid data request to any EtherNet/IP-compatible device;
- Symbolic or class/instance/attribute addressing;
- Supports various data types: STRING, BOOL, CONTROL, COUNTER, DINT, INT, LINT, REAL, SINT, TIMER, USINT, UINT, UDINT, ULINT, LREAL, STRING, DATETIME, DATE, TIME;
- Automatically detects a data type of returned data.
- Can read arrays.
- Can poll data by a custom interval.

2 System requirements

The following requirements must be met for "Ethernet/IP" to be installed:

Operating system: Windows 2000 SP4 and above, including both x86 and x64 workstations and servers. The latest service pack for the corresponding OS is required.

Free disk space: Not less than 5 MB of free disk space is recommended.

Special access requirements: You should log on as a user with Administrator rights in order to install this module.

The main application (core) must be installed, for example, Advanced Serial Data Logger.

3 Installing Ethernet/IP

1. Close the main application (for example, Advanced Serial Data Logger) if it is running;
2. Copy the program to your hard drive;
3. Run the module installation file with a double click on the file name in Windows Explorer;
4. Follow the instructions of the installation software. Usually, it is enough just to click the "Next" button several times;
5. Start the main application. The name of the module will appear on the "Modules" tab of the "Settings" window if it is successfully installed.

If the module is compatible with the program, its name and version will be displayed in the module list. You can see examples of installed modules on fig.1-2. Some types of modules require additional configuration. To do it, just select a module from the list and click the "Setup" button next to the list. The configuration of the module is described below.

You can see some types of modules on the "Log file" tab. To configure such a module, you should select it from the "File type" list and click the "Advanced" button.

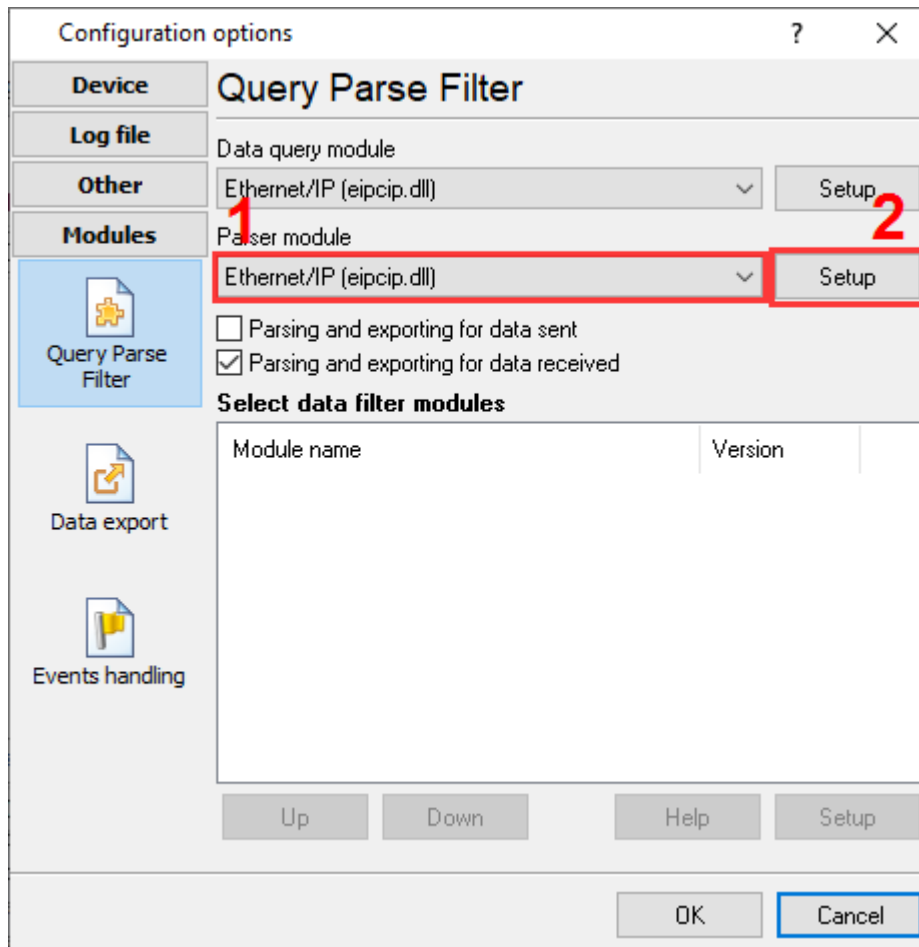

Fig. 1. Example of installed module

4 Glossary

Main program - it is the main executable of the application, for example, Advanced Serial Data Logger and asdlog.exe. It allows you to create several configurations with different settings and use different plugins.

Plugin - it is the additional plugin module for the main program. The plugin module extends the functionality of the main program.

Parser - it is the plugin module that processes the data flow, singling out data packets from it, and then variables from data packets. These variables are used in data export modules after that.

Core - see "Main program."

5 User Manual

5.1 Data query

To add new item click "Actions - Add new request". The dialog window will be shown (fig. 2). Enter a request description, that can contain any characters and click the "OK" button.

Fig. 1. Name dialog

The new request will appear in the requests tree (fig. 2). Each request has few important options:

Device path - a path to your EIP compatible PLC in the Ethernet/IP network.

It should be empty or 1 for direct connections.

Typically, the path is the **slot number** of the processor module in the backplane (chassis). The empty value means the default slot #0.

But if your communications card is not in the same chassis as your processor, this is the path through the chassis to get to your processor. You will have to add a 1 for every chassis you go through:

Example

Chassis 1: ENBT card in Slot 0
Path would be: { 0 }
Device path parameter: 0

Chassis 1: ENBT card in Slot 1
Path would be: { 1 }
Device path parameter: 1

Chassis 1: ENBT card in Slot 1 (slot is irrelevant), ControlNet Card in Slot 2
Chassis 2: L61 in Slot 4
Path would be: { 2, 1, 4 }
Device path parameter: 2,1,4

Address - it's an address (symbolic name) of a data item in the PLC's memory. If the item is an array then you may add an index in this array.

Examples:

VALUE1 - read data from the "VALUE1" tag.

VALUE1[2] - VALUE1 is an array and the program will read the 3rd element from this array (the array index starts from 0).

@22/1/1 - read data from class 22, instance 1 and attribute 1.

User-defined string data types

For example, let's say you have defined a custom string data type with a non-standard data length. In this case, the PLC exports this value as a general structure. If you set the "Data type" parameter to "String", our program will try to interpret the given structured value as a simple string data type.

Bitmask

A bitmask in PLC refers to a binary value used for data manipulation or bitwise operations. It is a technique that involves using specific bits within a number to represent certain conditions or states. By setting or clearing individual bits within a bitmask, you can control various aspects of a PLC program.

For example, if you have a decimal value of 15, it can be interpreted as a bitmask with the value 00001111, where bits 0-3 are set.

To extract an individual bit or bit range, set the "Data type" parameter to "Boolean" and include a logical path in the address field:

VALUE1#0 - extract bit #0 from a numeric value VALUE1.

VALUE1#4 - extract bit #4.

VALUE1#0:4 - extract bits from 0 to 4.

Number of elements to read - for arrays you may read the specified number of sequential elements.

Request timeout - after reaching the timeout limit the program will automatically cancel current request and execute next request in the queue. The timeout value depends on the network on which master (program) and slave (device) is running. If the network is slow then timeout value should be larger and if network is fast then timeout value can be small.

Export name - if this value is not empty the program will export the tag's value using this name. If the name is empty the program will use the value from the address field as a name.

Scale - if this parameter is not equal 1 then the program will scale a returned numerical value using this coefficient.

Default value - this value will be used if the parser can't get the specified values from a response.

Ethernet/IP 4.0.59.912

Requests queue

Property	Value
Request #1	
<input checked="" type="checkbox"/> Send requests, otherwise parse response only	
Device path	1
Address (e.g. Tag[0] or @22/1/1)	Tag
Number of elements to read	1
Data type	None
Request timeout (ms)	3000
Request method	
<input type="radio"/> Once, on the program startup	
<input checked="" type="radio"/> Polling	
Interval	10
Interval units	Second
Export name	EN
Default value	0
Scale (numbers only)	1

Action Export data for all requests at once

Minimal interval between data packets (ms)

OK Cancel

Fig. 2. Requests

5.2 Request method

The plugin can send requests in two modes:

- **Once, on program startup** - the program will send request once, when the program starts.
- **Polling** - the program will be sending request periodically based on an interval specified. The interval between requests depends on the network on which master (program) and slave (device) is running. If the network is slow then time for each request will be larger and vice versa. Because, the program are executing all requests in the queue one by one, then time between requests depends on the number of requests in the queue.

Request method	
<input type="radio"/>	Once, on program startup
<input checked="" type="radio"/>	Polling
Interval (ms)	5000
Interval units	Millisecond

Fig.3. Request methods

If you added few requests to the queue, then you can move it up and down. Select a request title and execute a corresponding menu item by clicking the "Actions" button. With help of this button you can change an item description and delete requests.

You can access all actions through the popup menu in the request tree.

5.3 AB Micro 800

This PLC series uses a symbolic addressing method. The program may read data from the "Global variables" area by a tag name. The logger should work in the TCP client mode and connect to a port #44818, directly to the PLC.

Name	Alias	Data Type	Dimension	Project Value	Initial Value	Comment	Retained
ALARM_MSG_9		ASCELOCADD					
ALARM_1_RESET		BOOL		FALSE			
ALARM_2_RESET		BOOL		FALSE			
ALARM_3_RESET		BOOL		FALSE			
ALARM_4_RESET		BOOL		FALSE			
ALARM_5_RESET		BOOL		FALSE			
ALARM_6_RESET		BOOL		FALSE			
ALARM_7_RESET		BOOL		FALSE			
ALARM_8_RESET		BOOL		FALSE			
ALARM_9_RESET		BOOL		FALSE			
ALARM_10_RESET		BOOL		FALSE			
ALARM_11_RESET		BOOL		FALSE			
HMI_NUMBER_1		STRING		'9737652320'	'9737652320'		2
HMI_NUMBER_1_SELECTED		BOOL		FALSE			
HMI_NUMBER_2		STRING		'8849093988'	'8849093988'		2
HMI_NUMBER_2_SELECTED		BOOL		FALSE			
HMI_NUMBER_3		STRING					2
HMI_NUMBER_3_SELECTED		BOOL		FALSE			
HMI_NUMBER_4		STRING					2
HMI_NUMBER_4_SELECTED		BOOL		FALSE			
HMI_NUMBER_5		STRING					2
HMI_NUMBER_5_SELECTED		BOOL		FALSE			
Tag1		INT			25		

Fig. 3. Tag in a PLC

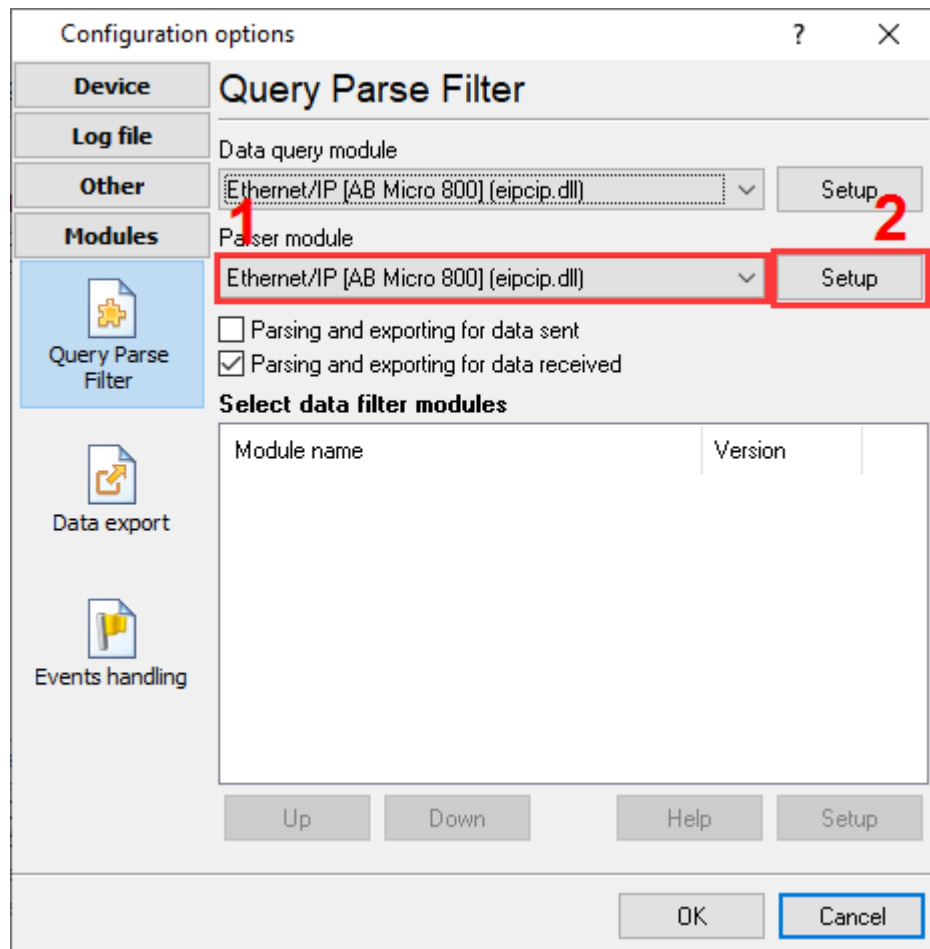

Fig. 4. Data parser

Property	Value
New item	
<input checked="" type="checkbox"/> Send requests, otherwise parse response only	
Device path	1
Address (e.g. Tag[0] or @22/1/1)	Tag1
Number of elements to read	1
Data type	Unsigned Decimal (16 Bit)
Request timeout (ms)	3000
Request method	
<input type="radio"/> Once, on the program startup	
<input checked="" type="radio"/> Polling	
Interval	10
Interval units	Second
Export name	EN
Default value	0
Scale (numbers only)	1

Export data for all requests at once
 Minimal interval between data packets (ms)

Fig. 5. Queue

5.4 AB MicroLogix 1400

This PLC series does not support a symbolic addressing method. The program may read data from area by a file type and address. The following file types are supported:

R - Control;
 C - Counter;
 F - Floating-point;
 I - Input;
 N - Integer;
 O - Output;
 T - Timer;

The data address should look like: N7:0

N - file data type ID.
 7 - file number.

0 - element address

The logger should work in the TCP client mode and connect to a port #44818, directly to the PLC.

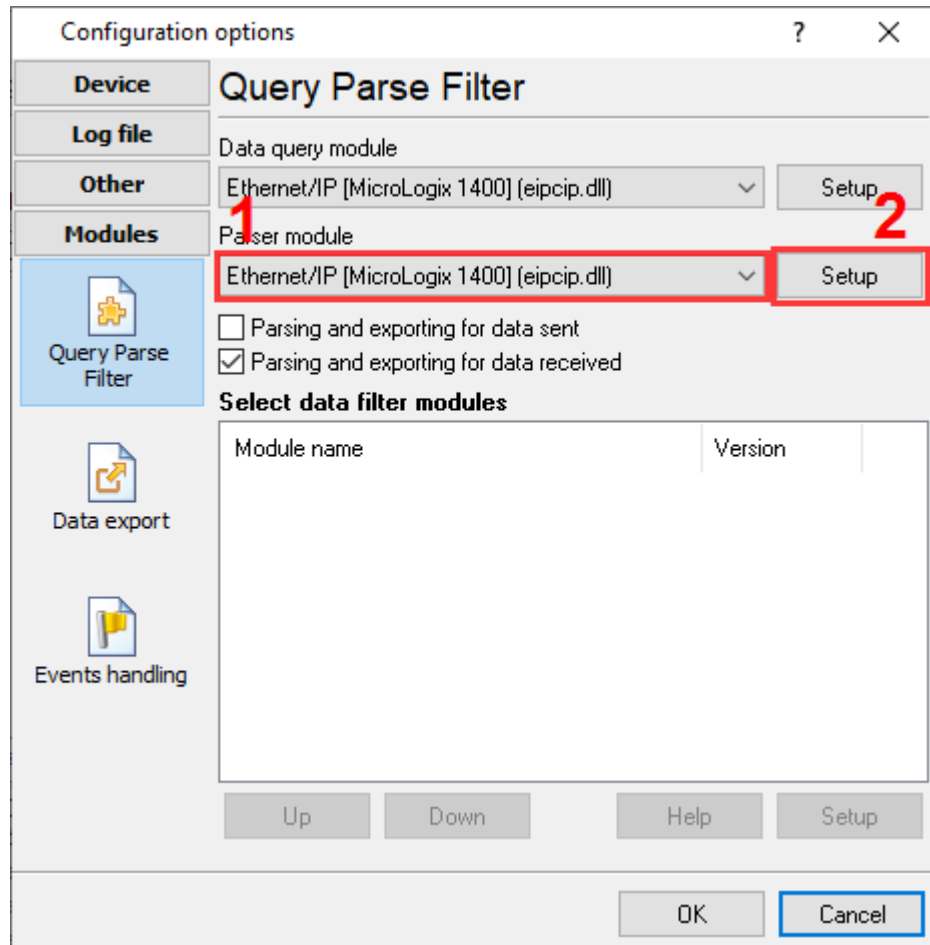

Fig. 6. Data parser

Ethernet/IP [MicroLogix 1400] 4.0.59.912

Requests queue

Property	Value
Request#1	
<input checked="" type="checkbox"/> Send requests, otherwise parse response only	
Device path	1
Address (e.g. Tag[0] or @22/1/1)	N7:0
Number of elements to read	1
Data type	None
Request timeout (ms)	3000
Request method	
<input type="radio"/> Once, on the program startup	
<input checked="" type="radio"/> Polling	
Interval	7
Interval units	Second
Export name	N7_0
Default value	0
Scale (numbers only)	1
Request#2	

Action Export data for all requests at once

Minimal interval between data packets (ms)

OK Cancel

Fig. 7. Queue

5.5 AB Logix 5550

This PLC series supports a symbolic (logical) addressing method. When the program connects to this PLC first time, it reads a list of all available PLC's variables with its names, memory location and data types. After this, internally, the plugin will convert a tag name to an instance ID for faster data reading. Furthermore, it increases reading rate because an instance ID allocates fewer bytes in a request, plus, you can combine several tags in one request.

The logger should work in the TCP client mode and connect to a port #44818.

Note: In this example, the program reads data from Slot 1 at Chassis 1.

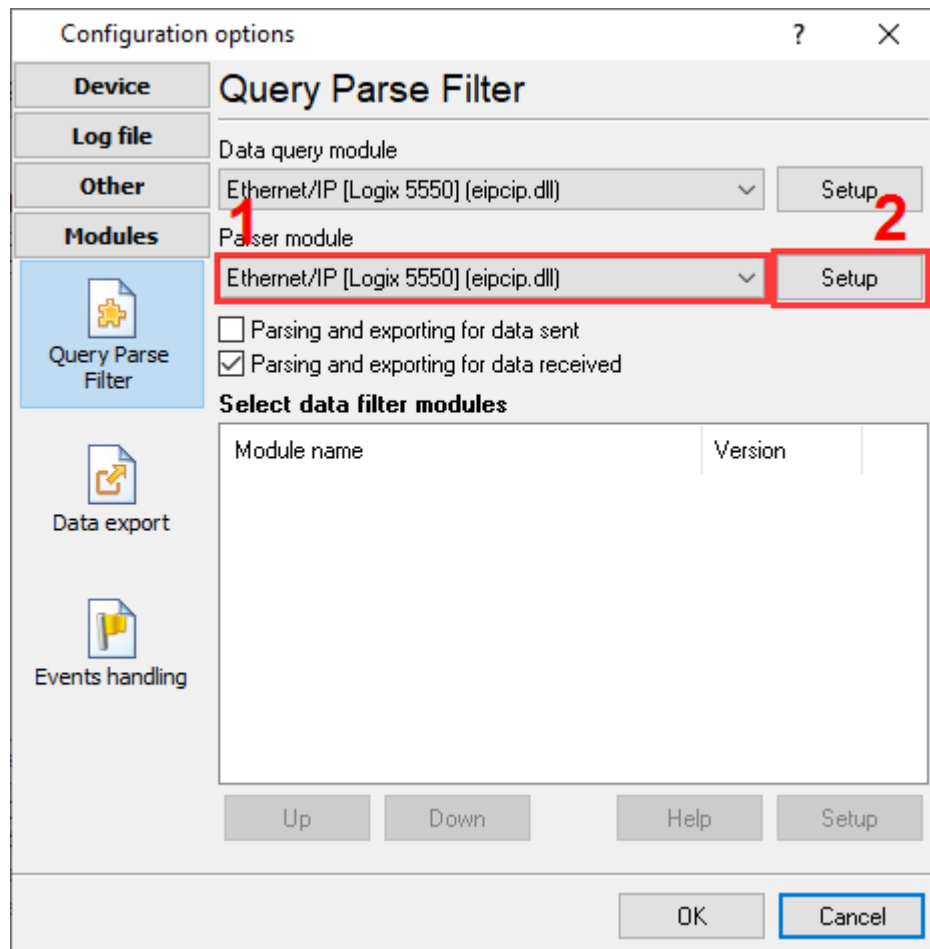

Fig. 8. Parser selection

Example 1: read one tag in a request

This method is useful if you need to process each tag individually, scale a value or export with a unique name.

Ethernet/IP [Logix 5550] 4.0.59.912

Requests queue

Property	Value
Request#1	
<input checked="" type="checkbox"/> Send requests, otherwise parse response only	
Device path	1
Address (e.g. Tag[0] or @22/1/1)	DINT
Number of elements to read	1
Data type	Unsigned Decimal (32 Bit)
Request timeout (ms)	3000
Request method	
<input type="radio"/> Once, on the program startup	
<input checked="" type="radio"/> Polling	
Interval	10
Interval units	Second
Export name	MY_NAME
Default value	0
Scale (numbers only)	1.5

Action Export data for all requests at once

Minimal interval between data packets (ms)

OK Cancel

Fig. 9. Queue

Parsed data example:

```
DATE_TIME_STAMP[7]=2024-09-26 14:20:07;DATA_SOURCE_FULL_NAME[8]
="10.107.89.30:44818";DATA_SOURCE_NAME[8]="172.0.0.1:44818";EIP_DEVICE[8]="1756-
ENBT/A";EIP_DEVICE_SN[3]=1111111;EIP_REQ[8]="Request1";EIP_ADDRESS[8]="DINT";DINT[3]
=19582
```

Example 2: combine tags with identical data types

Grouping data in one request increases reading rate. But in this case, you cannot specify an individual scale factor for all tags.

The screenshot shows a dialog box titled "Ethernet/IP [Logix 5550] 4.0.59.912". It contains a "Requests queue" section with a table of properties and values. The "Request#1" section is expanded, showing options for sending requests, device path, address, number of elements to read, data type, and request timeout. Below this is the "Request method" section with radio buttons for "Once, on the program startup" and "Polling" (selected). The "Polling" method has sub-properties for interval (10) and interval units (Second). At the bottom, there is an "Action" dropdown, a checked checkbox for "Export data for all requests at once", and a "Minimal interval between data packets (ms)" spinner set to 0. "OK" and "Cancel" buttons are at the bottom right.

Property	Value
Request#1	
<input checked="" type="checkbox"/> Send requests, otherwise parse response only	
Device path	1
Address (e.g. Tag[0] or @22/1/1)	DINT;MASS_DINT
Number of elements to read	1
Data type	Unsigned Decimal (32 Bit)
Request timeout (ms)	3000
Request method	
<input type="radio"/> Once, on the program startup	
<input checked="" type="radio"/> Polling	
Interval	10
Interval units	Second
Export name	MY_NAME1;MY_NAME2
Default value	0
Scale (numbers only)	1

Export data for all requests at once

Minimal interval between data packets (ms)

OK Cancel

Fig. 10. Queue

Parsed data example:

```
DATE_TIME_STAMP[7]=2024-09-26 14:20:07;DATA_SOURCE_FULL_NAME[8]
="10.107.89.30:44818";DATA_SOURCE_NAME[8]="172.0.0.1:44818";EIP_DEVICE[8]="1756-
ENBT/A";EIP_DEVICE_SN[3]=1111111;EIP_REQ[8]="Request1";EIP_ADDRESS[8]
="DINT;MASS_DINT";DINT[3]=19582;MASS_DINT[3]=123
```

Example 3: combine different tags in one request

This method works for simple data types only (e.g. INT, DINT, REAL, STRING, etc.). You cannot combine simple data type and structured (user-defined) data types in one request.

The screenshot shows a dialog box titled "Ethernet/IP [Logix 5550] 4.0.59.912". The main section is "Requests queue" with a table of properties and values:

Property	Value
Request#1	
<input checked="" type="checkbox"/> Send requests, otherwise parse response only	
Device path	1
Address (e.g. Tag[0] or @22/1/1)	DINT;INT;REAL
Number of elements to read	1
Data type	None
Request timeout (ms)	3000
Request method	
<input type="radio"/> Once, on the program startup	
<input checked="" type="radio"/> Polling	
Interval	10
Interval units	Second
Export name	MY_NAME1;MY_NAME2;MY_NAME3
Default value	0
Scale (numbers only)	1

Below the table, there is an "Action" dropdown menu and a checked checkbox "Export data for all requests at once". At the bottom, there is a "Minimal interval between data packets (ms)" spinner set to 0, and "OK" and "Cancel" buttons.

Fig. 11. Queue

Parsed data example:

```
DATE_TIME_STAMP[7]=2024-09-26 14:20:07;DATA_SOURCE_FULL_NAME[8]
="10.107.89.30:44818";DATA_SOURCE_NAME[8]="172.0.0.1:44818";EIP_DEVICE[8]="1756-
ENBT/A";EIP_DEVICE_SN[3]=1111111;EIP_REQ[8]="Request1";EIP_ADDRESS[8]
="DINT;MASS_DINT;REAL";VALUE1[3]=19582;VALUE2[3]=123;VALUE3[5]=789.455993652344
```

Example 4: reading an attribute of a value with structured data type

This method is used to read a value of complex (structured) data types.

Ethernet/IP [Logix 5550] 4.0.59.912

Requests queue

Property	Value
Request#1	
<input checked="" type="checkbox"/> Send requests, otherwise parse response only	
Device path	1
Address (e.g. Tag[0] or @22/1/1)	STRING.LEN
Number of elements to read	1
Data type	Unsigned Decimal (16 Bit)
Request timeout (ms)	3000
Request method	
<input type="radio"/> Once, on the program startup	
<input checked="" type="radio"/> Polling	
Interval	10
Interval units	Second
Export name	MY_STR_LEN
Default value	0
Scale (numbers only)	1

Action Export data for all requests at once

Minimal interval between data packets (ms)

OK Cancel

Fig. 12. Queue
